

Guide 3 of 5

When to Augment Decisions With Artificial Intelligence

Guides for Effective Business Decision Making

By 2025,

90% of current analytics content consumers will become content creators enabled by AI.

Source: Gartner

In the Gartner 2021 Reengineering the Decision Survey of executives, 47% of respondents said they expected decisions to become increasingly complex over the ensuing 18 months. This is driving interest in the application of data and analytics (D&A) to improve the quality of those decisions. However, organizations are also interested in improving the speed and accuracy of decisions, and that often requires automation.

Decisions that use data can be automated in a variety of ways but fall somewhere between being mostly human-based and entirely automated. Organizations that embrace some degree of decision automation are likely to achieve competitive advantage through more rapid decision making (algorithmic trading outpacing human-based trading in response to market volatility), more sophisticated decisions (inventory levels based on a wide variety of market signals) and more granular decision making (microsegmentation of customer segments).

The key for D&A and business leaders is to understand where to expand decision automation for better outcomes.

Gareth Herschel
VP Analyst, CDO Leadership

The decisions I make are more complex (stakeholders, choices) than 2 years ago

There is a higher expectation for me to be able to explain or justify my decisions

How to Use This Guide

1 Prepare

Understand the role of automation in decision making.

2 Establish

Know how, in practice, to blend human and artificial intelligence (AI) in hybrid decision making.

3 Engage

Use a decision intelligence framework to assess when to augment/automate decision making.

4 Tips for Delivery

Act intentionally to create an organizational competency in decision intelligence.

Prepare

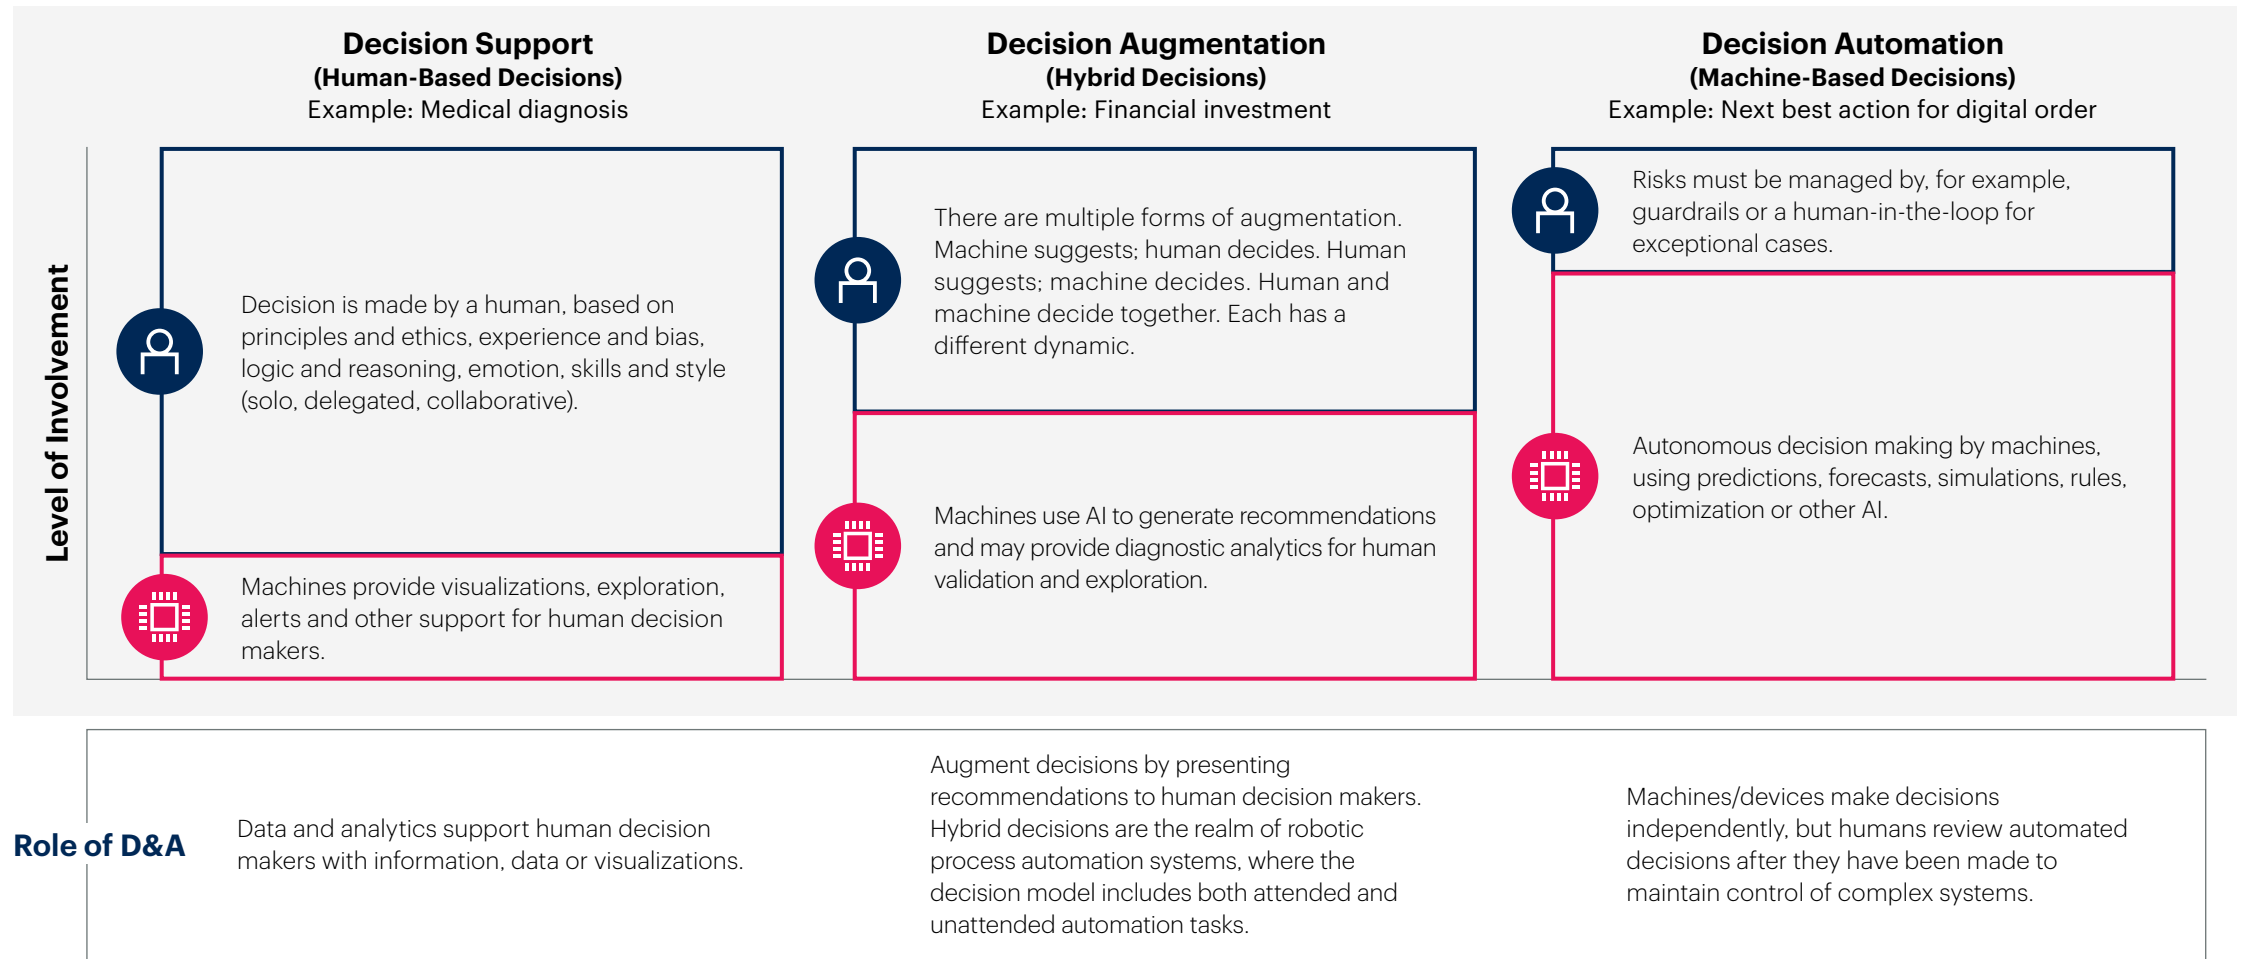

Understand the Role of Automation in Decision Making

3 Key Steps to Hybrid Decision Making in Practice

In practice, the role of automation in decision making is nuanced, with a series of categories defining a transition from decision support to augmentation to automation. Use the framework to the right to clarify where humans can and should be involved in decision making and the types of investment required.

3 Keys to Implementation

- 1 Move from one level to the next on the basis of organizational need, not technical ability.
- 2 Blend different levels, even within one decision, to balance risk and opportunity.
- 3 Do not view Level 7 as an automatic best practice or objective; the optimal level will vary for different decisions and depend on your culture.

The 7 Levels of Hybrid Decision Making

Level	Decision Support		Decision Augmentation			Decision Automation	
	1	2	3	4	5	6	7
	Human	Advisory	Recommendation	Approval	Veto	Audit	Autonomous
Data or Analysis Used	Determined by need and preference of human decision maker						
			Pre-identified in the context of the decision				
Who Proposes the Decision	Human (potentially using data and analytics)		Human and decision system both create Decision system				
Role of Human in Decision Approval	Approval of decision is an explicit action				Rejection of decision is an explicit action		
Decision Oversight	Review of decision process and choice		Routine review of previous decisions		Exception-based review of previous decisions

Engage

Leverage a Decision Intelligence Framework

The Gartner Decision Intelligence framework helps you model decisions while ensuring you detail the (re)design and application of components needed to support, augment or automate each phase in the decision flow.

Decision Intelligence

Gartner Decision Intelligence Components

Human: Actor with bias and goals making and supporting decisions

AI: Actor with goals and bias making and supporting decisions

Analytics: Supports, augments and automates decisions

Data: Informs decisions

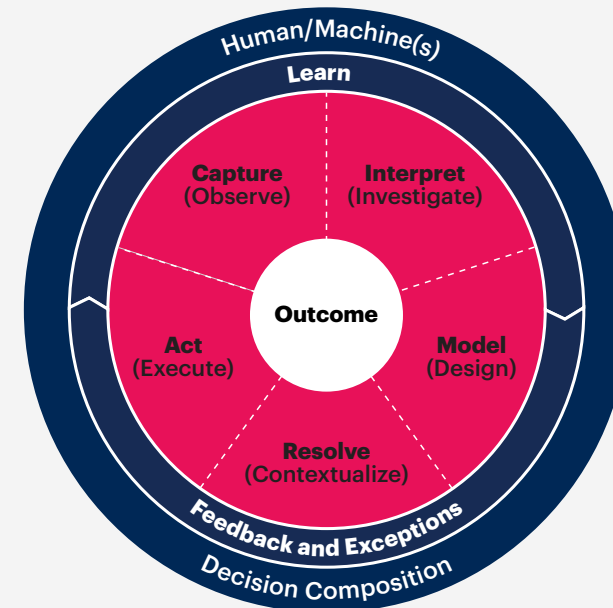

Applications: Sequences decision steps

Data Fabric

Shared Information and Data Architecture

Gartner Decision Intelligence Loop (Every decision goes through the same 5 phases)

Tips for Delivery

Act to Build Decision Intelligence Capabilities

The ability to identify, prioritize and then to model and (re)engineer decisions for improvement (i.e., decision intelligence) will be a critical competency for a disruption-ready and resilient organization.

Recommended actions:

-  Start with decision intelligence where business-critical decision making must be improved — requiring more data-driven support or AI-powered augmentation — or where decisions can be scaled and accelerated through automation. (Alternatively, start where there is the greatest dissatisfaction with current decision making as this could drive some quick wins.)
-  Build organizational competency in decision intelligence with a reusable, composable decision framework. This enables data-driven organizations to get the most out of their data. It turns the data into insights that target improvements in business performance and achievement of mission-critical priorities.
-  Improve decision making by first explicitly understanding and modeling how decisions are currently made and how they could be reengineered, and then by incorporating human and/or AI decision-making capabilities and a feedback loop for measuring results.
-  Consider creating a role for decision engineers by hiring or upskilling experts who can work with decision makers to identify critical decisions, which can be improved through engineering decision intelligence.
